Project Title: Digital Literacy & Online Safety Portfolio

Student Name: Omkar Kumar

Registration Number:

25BAI10893

Branch: B.Tech Computer Science and Engineering

University: VIT Bhopal

University Course: CSE0001 –

Date: 26 march 2026

Task 1: Digital Literacy Infographic

For this task, I used **Canva** to create a one-page visual resource focused on safe internet practices and professional online presence. My design has focused on four section:-

Section 1 :-Tools(github)
Github has become the resume for students particularly in tech world. It is the place where we put all our work for recruiters to see and it is the place where one can contribute in open source too. This is a great place for technical persons.

Section 2:-safety

As the world has been introduced to more technical things fraudster has also got more technical. For e.g. upi has made our life so much easier but it also opened the door for fraudster so that they can fraud money with the person as money could be transferred in one click. So safety is very important in this technical world.

Section 3:-professionalism tool(LinkedIn):-

This is the place where we set out education history , work experience and basically anything related to our career. It's the most necessary thing for tech people. It is also the place where people seek job opportunities.

Section 4:-useful tools (Canva):-

Just like for this project I got the need to use Canva to make posters and all this is also very important tools for students.

Task 2:- Digital portfolio

->we are living in a digital world where most of the work does happen in digital form and we all are aware that now offline resume has become almost useless. Everyone is on the internet so making our digital presence bigger will certainly help to connect with people and even for job seeking now ,online portfolio has become more and more relevant then ever.Some of my online portfolio are:-

1.Github:- Github is the place where we keep our work as a showcase or a place where we invite public to contribute to any open source project and even we can contribute to open source project . Contributing to open source project has many advantage like we learn how real projects work and even for job seeking employer does see a positive side if they see that the contender contribute to open source projects very frequently.

2.Kaggle:- This is website by google where we can practise and make something and be better in data science and machine learning. It has many tiers to judge that where one stand like master, grandmaster . Grandmaster title has immense respect in the community as its very difficult to achieve it .Its great place to improve our skills in data science and machine learning libraries.

3.Linkedin :- This is a kind of out biography related to our work like where we studied , where we worked ,and most of the thing that a recruiter want. This is the place where recruiter post if they need people to work for their company and job seeker can go on linkedin if they need a job .

Task 3:-Explore Coding & Collaboration Platforms

The coding platform that I actively participate is codeforces as I like to compete and it has problems in

rating wise which help me to improve myself rating wise . That is the platform which I like the most and enjoys the coding mainly on codeforces . I am also active on hackerrank but not like codeforces where I try to solve atleast one problem daily.

In this part I also learnt how to use google form . In real life if we need to do some survey we can use google form it's the best way .like in our university if the university official want some student advice like if they want our opinion in some changes related to mess ,then rather then calling all of us at gathering they can simply set up a google form and ask our opinion and we all can fill the form and seeing our responses they can take the necessary actions.

Task 4:- : Communication & Etiquette

In this task, I practiced professional email writing by drafting a request for an assignment extension and an internship inquiry. These scenarios taught me the importance of clear subject lines and structured bodies. A situation where poor digital communication caused a real problem involves the use of informal language in a professional Slack or email thread, leading to a misunderstanding of project deadlines. From this, I learned that maintaining a formal tone and clearly stating the purpose of the message (such as including a registration number) is crucial for student professor interactions.

Task 5: Cybercrime Awareness

While researching the **Jamtara** phishing case, I was most surprised by how scammers use social engineering and urgency to bypass technical security. It was eye-opening to see how simple

UPI "Collect Requests" are used to defraud people of their life savings. One habit I will personally change is my level of trust in unsolicited phone calls or "KYC update" messages. I have now bookmarked the **National Cyber Crime Portal (cybercrime.gov.in)** and saved the **1930 Helpline** in my phone to ensure I can report fraud immediately if I or a peer is targeted.

Conclusion:

Completing the Digital Literacy Portfolio has given me a structured approach to building my professional identity. As a CSE student, I now realize that digital literacy is a continuous process

of learning new tools, communicating effectively, and staying secure online. From mastering GitHub READMEs to understanding the psychological tactics of cybercriminals, I feel better prepared to act as a **Student Digital Ambassador**. These skills will serve as a foundation for my academic success at VIT Bhopal and my future career in the tech industry
